                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antematics representing E10.5/12.5 pancreatic bud, E16.5 pancreas, newborn pancreas, adult pancreas, and adult islets of Langerhams were seperately constructed using SuperScript Plasmid Library kit (Life Technologies). CDNA was made by oligo-dr priming and size-selected by column fractionation. Libraries were amplified once on solid support and plasmid DNA from each library was prepared and mixed in equal amounts. The mixed library DNA was normalized by method #4 from Bonaldo, Lennon, and Soares 1996 Genome Research 6:791-806; 0.5 microgram single-stranded mixed library plasmid DNA was increased mixed library plasmid DNA was normalized by method #4 from Bonaldo, Lennon, and Soares 1996 Genome Research 6:791-806; 0.5 microgram single-stranded mixed library plasmid DNA was mixed library inserts and bybridized to an Ecot of 6. Single-stranded cumpybridized, plasmids were isolated by pydroxyapatite
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            121 GICTCTTCTGCCACTGACGCCCCCATCAGGGATTGGGCCTTCTTTCCCCCT-TCCTTTTT 179

State Univ., from 2]; double-stranded cDNA was ligated to Bco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Bco RI sites of the modified pT713 vector. Library went through one round of normalization, and was constructed by Bento Soares and M.Fatima Bonaldo. /note="Vector: pSPORT1; Site 1: Not 1; Site 2: Sal 1; Five libraries representing E10.5/12.5 pancreatic bud, E16.5 pancreas, and adult plancreas, and seperately constructed using superScript Plasmid Library kit (Life Technologies). CDNA was made by oligo-dT priming and size-selected by column fractionation. Libraries were amplified once on Solid support and plasmid DNA from each library was prepared and mixed in equal amounts. The mixed library DNA was normalized by method #4 from Bonalod, Lennon, and Soares normalized by method #4 from Bonalod, Lennon, and Soares 1996 Genome Research 6:791-806, 0.5 microgram single-stranded mixed library plasmid DNA was mixed with 5 micrograms PCR product representing mixed library inserts and hybridized to an Ecot of 6. Single-stranded (unhybridized) plasmids were isolated by hydroxyapatite chromatography and used to make this library."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CF582778 966 bp mRNA linear EST 24-SEP-2003 AGENCOURT 11363244 updated NIH MGC_137 Mus musculus cDNA clone IMAGE:6432441 S', mRNA sequence.

/dev_stage="Adult and Fetal" /lab_host="DH108 (Life Technologies) (T1 phage resistant)" /clone_lib="UT-CF-EC1" /clone_lib="UT-CF-EC1" /note="Organ: Lung; Vector: pT7T3-Pac (Pharmacia) with a modified polylinker; Site=1: EcoR I; Site=2: Not I; UT-CF-EC1 is a normalized cDNA library containing the following tissue(s): Normal lung from adult and from fetal day 64, day 87, week 19 and week 42. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dr primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT773-Pac vector. The oligomicacide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is AAGTGCTTAC. TAG_TISSUE=Normal Lung Epithelial Cells Tissue nos 369-371 and 380-383 TAG_LIB=UI-CF-ECI TAG_SEQ=AAGTGCTTAC. /note="Organ: Ling; Vector: pT773-Pac (Pharmacia) with a modified polylinker; Site 1: EcoR I; Site 2: Not I; NCI CGAP DT1 is a normalized cDNA library containing the following tissue(s): Metatastic Chondrosarcoma in Lung. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT73-Pac vector. The oligomuclectide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is AACTGTTCGG.

with a modified polylinker; Site_1: BcoR I; Site_2: Not I;
NGI CGAP_EII is a normalized cDNA library containing the
following tissue(a): Chondrosarcoma. The library was
constructed according to Bonaldo, Lennon and Soares,
Genome Research, 6:791-806, 1996. First strand cDNA
synthesis was primed with an oligo-dT primer containing a
Not I site. Double stranded cDNA was ligated to an EcoR I
adaptor, digested with Not I, and cloned directionally
into pT7T3-Pac vector. The oligonuclectide used to prime
the synthesis of first-strand cDNA contains a library tag
sequence that is located between the Not I site and the
(dT).18 tail. The sequence tag for this library is
                                                                                                         Email: cgapbs-remail.nl.gov
Trissue Procurement: Dr. Jose Mercuende
cDNA Library preparation: Dr. M Bento Soares, University of Iowa
cDNA Library preparation: Dr. M. Bento Soares, University of Iowa
cDNA Library Arrayed by: Dr. M. Bento Soares, University of Iowa
DNA Sequencing by: Dr. M. Bento Soares, University of Iowa
Clone Distribution: Clone distribution information can be found
through the I.M.A.G.E. Consortium/LiML at: http://image.llnl.gov
The following repetitive elements were found in this cDNA
Seq primer: M13 FORWARD
POLYA-Yes.

NCI CGAP DTI is a normalized cDNA library containing the following tissue(s): Metastatic Chondrosarcoma in Lung.
The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an ECOR I adaptor, digested with Not I, and cloned directionally into pT773-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (GT)18 tail. The sequence tag for this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
